

To:.....

I am writing to you out of concern for your health and to ensure that you do not infect anybody else.

A person who has been treated for a chlamydia infection has stated that you may have been infected. There is a risk that you have the infection without experiencing any symptoms. Chlamydia is a bacteria transmitted through sexual intercourse. It is often without symptoms but can cause discharge from, and a burning sensation in the urethra. The infection can spread to the epididymis in the male and the fallopian tubes in the female, and is a cause of sterility. Chlamydia is treated with antibiotic tablets. Using a condom/femidom throughout any sexual activity provides good protection against chlamydia.

Call your advice centre for young people, STI clinic or care centre as soon as possible to book an appointment for testing. The test is carried out using a urine sample and you should not have weed in at least one hour. Staff confidentiality is absolute. All information that emerges during your visit is protected by professional secrecy. Tests and treatment is free of charge.

**You should not have sexual intercourse** until you have been examined and received the results. If you have sexual intercourse or other intimate contact before you have received the test results anyway, you must use a condom/femidom/dental dam throughout intercourse/the intimate contact.

If you have already been examined, please call us as soon as possible to let us know.

Phone number

Kind regards

**Don't forget to bring this letter to your appointment.**

**The testing must be done within two weeks.**

**Under the communicable diseases act, you are required to allow yourself to be examined.**
